
[The Paris Agreement Undermines the Global Campaign to Leave Oil in the Soil](#)

Almost 20 years ago, in the Japanese city of Kyoto, the Oilwatch network along with over 200 other organizations launched the pioneering proposal of the oil moratorium, in order to put an end to the problems that occur where fossil fuels are extracted, and also as the most effective way to combat climate change. Since then the campaign to leave hydrocarbons underground has spread all over the world. Oilwatch's arguments have finally been heard and embraced by many people.

However, this large group does not include governments or those who spearheaded the Conferences of the Parties to the United Nations Framework Convention on Climate Change (UNFCCC). In fact, the negotiations have been a total fraud, mainly since the Kyoto Protocol of 1997. The Kyoto Protocol is an international, legally-binding instrument that contains industrialized countries' commitments to reduce their emissions. These negotiations have ended up being mere business meetings, and totally illegitimate from a democratic standpoint. The 21st session of the Conference of the Parties (COP) in Paris, France was no different, nor was the recent meeting in the Moroccan city of Marrakech.

Since 1995, there have now been 22 Conferences of the Parties to the Convention on Climate Change. In these meetings, the Parties have issued at least 400 decisions and 20 resolutions; they have drawn up a Call, a Mandate, a Guide, an Action Framework, a Roadmap and a Protocol; they have agreed to two Action Plans, two Declarations and two Work Plans; they adopted an Accord and have signed four Agreements, including the Paris Agreement.

Meanwhile, greenhouse gas emissions and their consequences on the climate have continued to increase and worsen. Anyone with common sense would wonder why the problem persists, after so much time, expenditure of resources and bulky paraphernalia? The answer is obvious: none of the international climate negotiations has addressed the main cause of climate change: the extraction and burning of fossil fuels.

Reading the Paris Agreement carefully — and with our suspicion meter on — we see that the situation will get worse. According to those who promote the campaign to leave fossil fuels in the ground, this new Agreement denies the possibility of moving toward a post-oil civilization.

At a certain moment in the implementation of the Convention on Climate Change, what should have been counted — barrels of oil, cubic meters of gas and tons of carbon that should remain underground — transformed into the amount of carbon present in the atmosphere and reduction of CO₂ emissions. The purpose was simple: avoid a radical shift in the means of production and consumption while enabling the private sector to turn the climate crisis into a business opportunity.

The Paris Agreement now sets goals like "keeping the temperature rise below 2°C..." which makes it even more ambiguous and dangerous. This is in part because the average global temperature has already risen almost one degree since the beginning of the industrial revolution in 1850, and because the temperature is not the same everywhere on the planet. For example, according to the Intergovernmental Panel on Climate Change, Africa is probably the most warming continent and yet

And as we say in Latin America, "once the law has been made, so has the trap." The largest trap lies in the Paris Agreement, which creates a new market mechanism "to contribute to the mitigation of greenhouse gases and support sustainable development," involving transactions of "internationally transferred mitigation outcomes" (ITMOs). In other words, the carbon market that already exists—through the nefarious Clean Development Mechanism, European Union Emissions Trading Scheme, or the voluntary carbon offsets market, among others—can now exist between countries or regions. That is, if a country claims to have done a good job in reducing its emissions vis-a-vis promises in its INDCs, this favorable difference could be sold to another country that has polluted more.

This obviously repeats history: it does not reduce global emissions. On the contrary, it allows the mining and oil frontier to expand, agribusiness to grow, loss of forest cover to continue, and the aviation industry to grow. The aviation industry plans to increase its emissions by 700% and steadily increase the global transport of goods—problems directly responsible for global warming. (3)

With the Paris Agreement, the progress of the international Leave the Oil Underground campaign could be undermined, as many organizations unfortunately believe the Paris Agreement represents a paradigm shift; going as far as to say that it marks "the end of the era of fossil fuels" (350.org, US-based organization that works on the issue of climate change) or that the Paris Agreement "will drive the global energy revolution" (the NGO Greenpeace). It will not do any of this.

For the Ecuadorian government, the Paris Agreement "represents the starting point of a world with clean energy, through effective implementation of firm strategies to reduce global emissions of greenhouse gases." These words mean nothing coming from the mouths of those who have begun oil exploitation in the internationally renowned Yasuní National Park, in block 43-ITT (see the article Women and oil: The struggle for Sumak Kawsay in WRM Newsletter No. 200). This is further evidence of the government's resignation not to be a leader on climate, disappointing Ecuadorians and the world—since the Yasuní-ITT Initiative (4) was going to leave 850 million barrels of oil in the ground.
