<b>From REDD+ projects to ‘jurisdictional REDD+’: more bad news for the climate and communities</b> .....	11
---	----

From WRM Bulletin 231, June 2017

REDD+ is turned from individual projects to programmes that cover whole regions or provinces within a country, to eventually cover whole countries. These new kinds of REDD+ initiatives are often called 'jurisdictional REDD+'. The impacts for communities may well be much the same as from REDD projects: communities are first in line to face restrictions on traditional forest use practises and last in line for receiving meaningful compensation or ‘benefits’ that REDD+ is supposed to generate for forest-dependent communities. This article looks at what is motivating this change from REDD+ projects to ‘jurisdictional’ REDD+.

<b>REDD+ in the Paris Agreement secures funding for conservation industry while large-scale deforestation advances unhindered</b> .....	16
---	----

From WRM Bulletin 228, January 2017

Despite the dismal track-record of REDD+ over the past 10 years, corporate and institutional investors such as the Green Climate Fund or the governments of Norway and Germany, together with their partners from the conservation industry, keep announcing new REDD+ initiatives. Growing evidence, however, shows that if the goal is reducing forest loss and tackling the root causes of climate change, continued funding for REDD+ is counterproductive. REDD+ above all allows actors within the development and conservation industry continued access to financial resources.

<b>REDD and rights: The good, the bad and the ugly</b> .....	20
--	----

From WRM Bulletin 234, November 2017

The proposal to include forests in the UN climate negotiations is now 10 years old. Since then, the issue of human rights and the rights of indigenous peoples, women, local communities, and others, has been an interplay of actors, scripts, stages, casts and comedies. When the concept of rights is part of climate negotiations, it prioritizes benefiting the free market, meanwhile nullifying the cultural and political contexts of the villages and peoples where these kinds of projects or programs are carried out.

<b>Brazil. Envira REDD+ project in Acre: Gold certificate from carbon certifiers for empty promises</b> .....	24
---	----

From WRM Bulletin 237, April 2018

This is one of the three REDD+ ventures that the US-based company CarbonCo LLC is pursuing in the Brazilian state of Acre. A rubber tappers community finds itself as part of

the 40,000-hectare project. The community faces a difficult struggle to maintain its way of life. The Project, making claims based on questionable land titles, has already sold carbon credits, yet the only 'benefits' to the community have been dental kits and a visit to the dentist.

**REDD Alert! How REDD+ projects undermine peasant farming and real solutions to climate change** ..... 28

From WRM Bulletin 219, October 2015

Agriculture is increasingly being discussed at high level forums on climate change that promote initiatives which they claim will help farmers to adapt to climate change and reduce agriculture's greenhouse gas emissions. One such initiative is REDD+. REDD+, however, reinforces the corporate food system that is largely responsible for climate change, has robbed many communities and forest peoples of their territories and undermines the food and agricultural systems of peasants and indigenous peoples that can in fact cool the planet.

**What is the biggest REDD+ contradiction?** ..... 33

From WRM Bulletin 208, November 2014

For years, a group of banks, corporations, governments and conservation NGOs have been attempting to show that REDD+ is a good mechanism for combating climate change. However, as WRM has sought to learn more about REDD+ and especially, the projects that have been implemented, what we have seen is a consistently failed mechanism that suffers from many structural contradictions. This article reviews some of the most serious contradictions of the REDD+ mechanism.

**REDD+ myth: Sustainable Forest Management** ..... 36

From WRM Bulletin 207, October 2014

The UN climate negotiations included the concept of 'Sustainable Forest Management' (SFM) in REDD+ during the 2010 agreements. SFM is one of the '+' ('plus') parts of REDD. Under REDD+, SFM is promoted as a way of achieving emissions reductions. This is a myth. The reality is that SFM allows destructive and often illegal logging to continue with impunity.

# 1. Introduction

More than 30 years ago, during FAO's World Forestry Congress in 1985, the Tropical Forestry Action Plan (TFAP) was adopted as the new international framework to address the deforestation problem. Representatives of bilateral and multilateral donor agencies, supported by some international NGOs, also accepted the TFAP (later renamed into Tropical Forests Action Programme) as a framework for their activities and funding related to tropical forests. (1)

The World Bank paved the road for TFAP with pilot projects and investment programmes. Over the course of 10 years, more than one hundred countries embarked on TFAP processes, directed by the FAO, in partnership with the World Bank, the United Nations Development Programme (UNDP) and the World Resources Institute (WRI). Ministries in countries of the global South prepared national plans to address the deforestation crisis in relation to specific areas the TFAP had identified as "critical". All of these were related to promoting a neoliberal set-up of state institutions as well as a segregated land use promoting industrial tree monocultures and the related export and processing industries on the one hand and strict protected forest areas that deprived local communities of access to the forest on the other ('parks without people'). While the forest crisis continued and deforestation soared, the majority of the TFAP initiatives had collapsed by 1995 – though many of the negative impacts for forest communities remained much longer.

Since 2005, funding from the World Bank and FAO (as well as from UNDP and WRI and a handful of industrialized country donors and international conservation NGOs) has been again pushing forward pilot initiatives, national policy and investment schemes in countries with tropical forests in the global South. Again, the stated objective is to tackle the deforestation crisis. The 'development' objective of the TFAP was replaced with another one: addressing the climate crisis, through reducing emissions from forest destruction. This time the 'plan' was called REDD+ (Reducing Emissions from Deforestation and Forest Degradation). (2)

REDD+ advocates largely blame small-scale peasant agriculture and indigenous peoples' forest use for deforestation, while working in partnership with the actual actors responsible for large-scale deforestation. At the same time, those corporate actors lose interest in REDD+ the moment it would require significant changes in their business model.

## **From TFAP to Jurisdictional REDD+: Keeping power structures intact**

The REDD+ scheme is now being transformed into what is called 'Jurisdictional REDD+' or sometimes 'Landscape REDD+'. The change is mainly based on the idea

of accounting for emission reductions not from individual projects but from a whole state or provincial jurisdiction, with the idea of gradually covering entire countries.

Under Jurisdictional REDD+, entire 'landscapes' are made to fit into the carbon balance sheets of greenhouse gas accountants. The complex problem of deforestation is reduced to technical exercises of doing carbon assessments and carbon mapping (showing where forests with most carbon stored in the trees are, using largely satellite technologies). Yet, deforestation is fundamentally a political problem. But this is ignored when these accounting and mapping exercises construct the story of where supposedly the problem lies and what solutions would be needed to address the forest and climate crisis. The focus of REDD+ (as well as of Jurisdictional REDD+) on measuring and monitoring carbon has diverted attention away from the direct and underlying causes of deforestation – violation of forest peoples' territories and customary land use, industrial agriculture and monoculture tree plantations - erroneously called 'forests' by the UN FAO -, cattle ranching, commercial logging, extraction of minerals, gas and oil, large-scale infrastructure and the associated development model that relies on ever-growing consumption.

### **California's carbon market: A 'green' pass for the oil and gas industries**

The state of California in the US has been seeking to integrate other jurisdictions into its state carbon market programme, now extended until 2030. The first thing to note about California's emission reductions targets is that they are extremely low. And these low targets are further undermined with the use of a carbon market. Among several other corporate giveaways, companies are allowed to 'compensate' for their excess pollution without making emission reductions on site. As a result, polluters can keep polluting while vulnerable communities affected by their operations continue suffering aggravated impacts. It is important to recall that major polluters in California –refineries and power plants- are concentrated in communities of colour and low-income communities.

California's carbon market also prevents local air districts from passing regulation on pollution sources covered by it. (3) It is of no surprise that the fossil fuel industry and others spent millions of dollars lobbying to influence California's legislation. (4) California's governor Jerry Brown himself has close links with the oil industry. During Brown's administration, more than 20,000 permits for new drilling have been issued, and it was reported that 26 energy companies, including Chevron and Occidental, donated 9.8 million dollars to Jerry Brown's campaigns, causes, and initiatives, and to the California Democratic Party since he ran for Governor. (5)

Furthermore, California's carbon market keeps its door open to international forest carbon credits.

### **The Governors' Climate and Forests Task Force**

During the 2008 UN climate negotiations, the Governors' Climate and Forests Task Force (GCT) was launched. With the goal of creating a mechanism for cooperation

between sub-national jurisdictions, the GCT seeks to integrate REDD+ into the mandatory regional carbon market regimes in the United States, such as that of California. It is made up of members from 35 states and provinces from Brazil, Colombia, Indonesia, Ivory Coast, Mexico, Nigeria, Peru, Spain, and the United States.

In 2010, the government of Acre created the Environmental Services Incentives System (SISA, Sistema de Incentivos aos Serviços Ambientais) with the goal of fostering the maintenance and expansion of the "supply of ecosystem services and products" in the state. It is considered globally the most advanced Jurisdictional REDD+ program that exists. While the government of Acre tries to misleadingly associate the image of the internationally renowned rubber tapper leader Chico Mendes to its REDD+ program, communities in Acre, on the other hand, keep honouring his ideas. 30 years ago, in December 1988, Chico Mendes was killed in the town of Xapuri for defending the rubber tapper's rights to the forest.

Almost in parallel, the state of Chiapas in Mexico began to develop the Climate Change Action Program in 2009 to give priority to the implementation of Jurisdictional REDD+. The state was already in the process of implementing REDD+ programs in the Lacandon Forest, a territory where indigenous peoples' communities live. The area also has a long history of social conflicts and struggles, including the widely known Zapatista movement, which keeps fighting for their autonomy and self-determination.

In 2010, the state governments of California, Acre, and Chiapas signed a Memorandum of Understanding on Environmental Cooperation with the goal of creating a REDD+ carbon credit system between the three jurisdictions. The system would channel REDD+ funding into Acre and Chiapas, in exchange of compensation or offset credits for polluters in the state of California. (6) REDD+ credits would allow pollution in California to continue.

Until now, the Governors' Climate and Forests Task Force (GCT) has not gone beyond discussions, conferences and consultancy papers. However, this process could advance during the Global Climate Summit to be held in San Francisco, in September 2018, as the GCT annual meeting is scheduled to take place just before the Summit. (7) They plan to launch a report on the state of the jurisdictional REDD+ "experiments" worldwide (8).

## **Final remarks**

The outcomes of Landscape or Jurisdictional REDD+ will likely not differ much from those of TFAP or REDD+ projects. The approach remains as top-down and condescending towards forest-dependent communities and is focused on collaboration with the agribusiness and logging sectors - just like the FAO and World Bank's failed TFAP. Industrial agriculture and logging, infrastructure mega-projects, mining, oil and hydro dams will continue to cause large-scale deforestation and the related emissions, and in the process will cause a lot of harm to forest-dependent and peasant communities. And to add insult to injury, the REDD+ narrative falsely blames those communities who have been the guardians of forests

for generations for their destruction.

In May 2017, forest dwellers, rubber tappers and different indigenous peoples united in Xapuri, Brazil, and declared that “We express our indignation about the false solutions, which legitimize the continuity and expansion of a socially and environmentally destructive model. We reject initiatives to offset pollution. We do not accept mechanisms based on restrictions on our way of life, and we express solidarity with people living in the areas that are contaminated by companies seeking compensation (offsets). We stand by the people from other countries who live in the areas impacted by the pollution generated by destructive companies. No one should live in contaminated areas; it is time to end all kinds of racism, including environmental racism.” (9) Likewise, Marcus Franklin, from the National Association for the Advancement of Colored People, said at the release of a report that accounts for many of the impacts suffered by communities of colour living near oil and gas facilities in the US, that the exposure to pollutants is tied to deeper systemic issues of oppression and poverty, adding, “it is time to shape an energy future that is not exploitative and does not profit from acts of environmental racism.” (10)

## 2. Compilation of WRM bulletin articles

### From REDD+ projects to 'jurisdictional REDD+': more bad news for the climate and communities

[From WRM Bulletin 231, June 2017](#)

**As REDD+ is turned from projects to 'jurisdictional REDD+', it may well lead to either stranded private sector REDD+ projects or a high risk of already dodgy reduction claims being counted twice, by the buyer of a REDD+ credit and the jurisdiction involved.**

For many people, REDD+ is about projects that save forests. In reality, however, REDD+ has never been about protecting forests and also no longer really is about projects but about programmes covering whole regions or provinces within a country. Though many REDD+ projects continue to exist, causing harm to indigenous peoples and forest communities by restricting their traditional forest use practises. (1)

The idea of REDD+ has its roots in the UN climate negotiations. It was negotiated as a tool that would allow companies and industrialized countries to continue burning petroleum, coal and natural gas while claiming the emissions this causes do not harm the climate. REDD+, its advocates claim, would provide cheap compensation for the release of these emissions into the atmosphere and provide money to finance forest protection. Companies in industrialized countries could burn fossil carbon at home, that is the carbon stored underground for millions of years, and pay someone in a tropical forest country to keep some trees standing as a replacement carbon store. (2)

The truth is that money alone doesn't stop deforestation; that REDD+ isn't tackling the actual causes of large-scale deforestation and that money from the private sector hasn't been forthcoming at any scale. REDD+ advocates who had advertised REDD+ as a triple-win (cheap compensation for fossil fuel burning, extra money for forest conservation and supporting communities who live in and from the forest and contribution to climate protection that can be realized now while technology for move away from fossil fuel is developed) have also had to grudgingly acknowledge that halting deforestation is neither fast nor easy or cheap. Convincing evidence is missing that REDD+ has made a dent in deforestation despite claims to the contrary.

Another motivation behind REDD+ is the intention of industrialized countries to avoid paying the bill for tropical forest protection although a "development" debt

remains. Industrialized countries are increasingly transforming ‘development aid’ grants into loans and private-public-partnership schemes where the main role of public money is to provide a risk buffer for private capital investments in so-called developing countries. (3) Two reports commissioned by the UK government – the Stern report 2006 and the Eliasch review 2008 – helped governments to claim that ‘private sector capital is needed to save tropical forests because public money alone will not be sufficient’ to cover the supposed cost of reducing deforestation. It was these two reports that established the unfounded claim that reducing emissions from deforestation is cheap, fast and easy.

For international conservation organisations and the World Bank, REDD+ also provides a tool to expand their ‘parks without people’ model of forest conservation and ensures corporate and public funding for their conservation projects and organisational budgets. Conservation NGOs and consultants based in industrialized countries have to date probably received the lion’s share of public money spent on REDD+ in the last ten years. Even though these groups claim to do ‘participatory REDD+’ and ‘community REDD+’ projects, REDD+ is not an idea that originated from communities. REDD+ is also not suitable to address the needs and threats that forest-dependent communities face, as experience has clearly shown during the past ten years. (4) Critics of REDD+, including WRM, have discussed these misconceptions and hidden motivations behind REDD+ many times.

Less has been written about the change of REDD+ from projects to programmes that cover whole regions or provinces within a country. These new kinds of REDD+ initiatives are expected to eventually cover whole countries. They are often called ‘jurisdictional REDD+’ because they will be implemented not just on the land assigned to individual REDD+ projects but across a whole jurisdiction, like a department, a province, a state or a whole country. This article looks at what is motivating this change from projects to ‘jurisdictional’ REDD+.

### **What is ‘jurisdictional REDD+’?**

Because REDD+ is linked to the UN climate negotiations, the UN climate talks also determine what REDD+ looks like. REDD+ initiatives that want to sell their carbon credits to the UN carbon market, will need to comply with the UN climate agreement rules. In reality, pilot programmes such as the World Bank Forest Carbon Partnership Facility and private sector REDD+ projects that already sell carbon credits to companies in the so-called voluntary carbon market, also have a big influence on these rules. Lobbyists from the World Bank and conservation NGOs are present at the UN climate meetings and meet with government officials that decide on the UN’s rules for REDD+.

From 2005, the World Bank, international conservation groups and private companies started to implement REDD+ projects that would be compatible with a mechanism more or less like the Kyoto Protocol’s Clean Development Mechanism: individual projects or clusters of projects in countries without binding emission targets in the global South would sell carbon credits to companies and industrialized

countries that have binding emission limits. But the UN Paris Agreement from 2015 turned out very different from the Kyoto Protocol (see also WRM Bulletin 228, January 2017). Under the Paris Agreement on climate change all countries have voluntary emission targets and will be presenting their national greenhouse gas balance sheet to the UN climate convention. These balance sheets will show how far a country has advanced in achieving the target they have set for their country. None of these Paris Agreement targets are binding. (5)

But carbon markets need binding targets, or some kind of pressure to limit emissions to function. The assumption that REDD+ could attract private sector funding if REDD+ projects are able to sell carbon credits in a global carbon market will not work anymore. Limits create the demand, hence: no (binding) limits, no demand for REDD+ credits from a UN carbon market.

Moreover, most tropical forest countries in the global South have included reductions in emissions from deforestation into their national commitments under the Paris Agreement. Therefore, they will have to calculate how much greenhouse gas emissions is happening in their country and present these figures in a national balance sheet. Most tropical countries decided to include emissions from deforestation and forest degradation in this national accounting sheet. And they will have to submit their national 'carbon accounts' regularly to the UN to demonstrate their progress towards the reduction goal they set for themselves (in UN climate language, these goals are called NDCs – nationally determined contributions).

From 2020, when the UN Paris Agreement comes into force, every carbon credit sold by a REDD+ project located in a country that also includes (carbon stored in) forests in its national carbon balance will have to be deducted from the country's national carbon balance sheet. If the credit sold by the project is not deducted from the national balance sheet, there is what in UN climate language is called 'double-counting' because the buyer of the carbon credit will also claim a reduction in his own balance sheet – after all, that is why he bought the REDD+ credit. This means that the emissions look lower on paper than they are in reality. And that in turn increases the risk of dangerous climate change.

Double-counting will be very likely under the Paris Agreement if private sector REDD+ projects continue to sell carbon credits. (6) Even a report by the Gold Standard, a company certifying carbon credits, recently warned about this risk. (7) That continued selling of REDD+ carbon credits by private sector REDD+ projects will create a mess under these circumstances can already be seen in the Brazilian state of Acre. There, the German government is funding a 'jurisdictional REDD+' programme called 'REDD Early Movers'. (8)

The German government programme has paid a total of 25 million Euro between 2012 and 2016 to the government of Acre in return for the state of Acre submitting documents showing that emissions from deforestation in Acre had stayed below a level agreed in the REDD contract between the two governments. That level was very generous. It did not require additional emission reductions to those already achieved in previous years because the calculation included the high-deforestation years 2003-2005. Law enforcement measures by the Brazilian state had already led to steep reductions in deforestation rates in the following years. One

could argue that the German government was paying Acre for emission reductions achieved in the past through non-REDD+ measures, or that Germany was paying Acre to maintain the forest carbon stock, a concept that had been rejected as unaffordable during the early years of UN negotiations about REDD+.

The state of Acre can use the money for any activity it deems necessary to reduce deforestation. A closer look at what the Acre government has decided to spend the money on reveals among others that much money has gone into consultancy reports and studies and very little has reached communities. This is mirroring many of the widely documented problems with REDD+ elsewhere.

### **What does REDD Early Movers in Acre tell us about 'jurisdictional REDD'?**

Looking at the 'REDD Early Movers' programme in Acre also reveals the contradictions that arise when 'jurisdictional REDD' programmes try to integrate private sector REDD+ projects that are already selling carbon credits on the voluntary carbon market. In Acre, at least three such projects exist: The Purus, Valparaiso and Envira REDD+ projects. The carbon balance sheet prepared by the government of Acre for the 'REDD Early Movers' programme with Germany deducts 10 per cent of the state's emission reductions from the balance sheet to account for the carbon credits sold by these three REDD+ projects. Purus for example sold carbon credits to the FIFA for compensation of part of the emissions from the 2014 Football World Cup. Adding up the numbers, however, shows that these three projects are claiming far more than the 10 per cent deducted in the state's carbon balance sheet. That means, it is possible, if not likely, that some of the reductions (if they happened at all) are counted twice: By the private sector REDD+ project selling carbon credits, as in the FIFA case, and by the state of Acre in its carbon balance sheet. From 2020, that risk will arise in many more countries. Particularly likely are such situations in countries like Peru, Kenya or the Democratic Republic of Congo (DRC) (9) with several or large existing private sector REDD+ projects already selling carbon credits and where the companies running these projects are involved in designing 'jurisdictional REDD+' programmes.

As the example of Acre shows, for communities, the impacts of 'jurisdictional REDD' programmes may well be much the same as those caused by individual REDD+ projects: being first in line to face restrictions on traditional forest use practises and last in line for receiving meaningful compensation or 'benefits' that REDD+ is supposed to generate for forest-dependent communities.

## **REDD+ in the Paris Agreement secures funding for conservation industry while large-scale deforestation advances unhindered**

[From WRM Bulletin 228, January 2017](#)

**Those responsible at the European Investment Bank, the Green Climate Fund or in the governments of Norway and Germany and other funders keep ignoring the growing evidence showing that if the goals are reducing forest loss and tackling the root causes of climate change, continued funding for REDD+ is counterproductive – and that REDD+ above all allows actors within the development and conservation industry continued access to financial resources.**

The “conservation industry” – groups such as The Nature Conservancy, WWF, Conservation International, consultants and auditors of REDD+ projects – and funders like the World Bank celebrated the formal recognition of REDD+ in the Paris Agreement on Climate Change in December 2015. They have been lobbying for an inclusion of REDD+ into global carbon markets established by the UN’s Kyoto Protocol for nearly a decade. For communities affected by REDD+ projects and programmes, however, the news will have been no reason to celebrate. Faced with harassment, tenure insecurity and restrictions on their traditional forest use, forest peoples and traditional forest users have been on the sharp edge of the REDD+ experiment that has seen the conservation industry pocket hundreds of millions, if not billions, of dollars, Norwegian kronor and euros for the unfulfilled promise to turn REDD+ into a successful forest conservation tool that will halt deforestation.

In reality, REDD+ is not designed to protect forests or reduce deforestation but to enable corporations and industrialized countries to continue burning fossil carbon even longer. Instead, REDD+ falsely singles out small-scale farming and shifting cultivation as the main cause for the destruction of tropical forests. Perhaps it should not come as a surprise that the result of 10 years of conservation industry experimenting with REDD+ is an increase in forest loss in several areas where REDD+ projects have been implemented – REDD-Early Movers programme in Acre, Brazil and the Mai N’dombe REDD+ project in the Democratic Republic of Congo, to name just a few (1). Worse than that, REDD+ implementation on the ground has resulted in severe restrictions on forest peoples’ traditional land use while large-scale cattle ranching, mining, hydro-dam and infrastructure developments continue unabated, destroying large swaths of tropical forests. Thus, REDD+ has shown to be the wrong tool for tackling the drivers of large-scale destruction. (2)

Yet, despite the dismal track-record of REDD+ over the past 10 years, corporate and institutional investors and their partners from the conservation industry keep announcing new REDD+ initiatives. The European Investment Bank, Conservation International and an investment fund called ‘Althelia Climate Fund’, for example, received a total of US\$53.5 million (US\$ 35 million investment and US\$ 18.5 million as grant) from the UN Climate Convention’s Green Climate

Fund (3) for a REDD+ programme in Madagascar. Norway, corporations from the global food industry (responsible for deforestation and substantial greenhouse gas emissions) and the World Bank's Global Environmental Facility (GEF) announced a new "tropical forest and agriculture focused fund" at the World Economic Forum 2017 in the Swiss luxury ski resort Davos. The new fund is said to use a 'jurisdictional approach', (see below), and mentions Brazil and Indonesia as initial countries where projects are to take place. Global food companies that are said to be interested in supporting the fund include Carrefour, Mars, Nestlé, and Unilever – the latter having announced an investment of US\$25 million over a five year period into the fund.

But do these global food corporations really want us make believe they care about forests and forest peoples' rights? The motive of protecting market shares – and therefore, profit margins – in industrialized countries and urban centers where consumers increasingly demand 'deforestation-free' products seems more plausible. It would also explain why these corporations are not presenting initiatives to reduce corporate control of the international food system and a strengthening of the less carbon-intensive peasant farming models. Expecting such measures from global food corporations would be like expecting that fossil fuel corporations lobby the UN to adopt a strong climate agreement that clearly spells out an end to fossil carbon burning in the near future.

Why do governments such as Norway and Germany, the European Investment Bank (EIB) and corporations such as Unilever keep pouring new money into REDD+ despite the initiative having "fallen far short of what was hoped"? (4) A recent academic article provides some explanation. 'Promising Change, Delivering Continuity: REDD+ as Conservation Fad' explains that for the conservation and development industry, REDD+ serves to help them ensure "to generate value and appropriate financial resources." (5) A fad is a "form of collective behavior that develops within a culture, a generation or social group and which impulse is followed enthusiastically by a group of people for a finite period of time". And usually, effectiveness or suitability of the fad to the solving of the actual problem matters little.

The article notes that a recent study of "23 of the 300 sub-national initiatives showed that only 4 had managed to actually sell carbon credits and found that funding is a key challenge to sustain the initiatives." The article also mentions technical "challenges", and explains that "marketing of carbon credits under the voluntary carbon standard systems involves complex technical procedures and requirements."

The authors explain that while the language and arguments change when the conservation industry comes up with a new proposal to save forests – that "REDD+ implies change at the discursive level." One such recent change in the REDD+ discussion is the term 'jurisdictional REDD+'. It means that governments and development banks are moving away from funding individual REDD+ projects and instead aim to put REDD+ activities in place at the level of a whole province, state and ultimately, an entire country. The German government's REDD Early Movers programme is an example of a 'jurisdictional' REDD+ programme where

the German government pays the government of the Brazilian state of Acre if Acre can provide evidence that deforestation in the state has not exceeded an agreed maximum of forest loss. The new tropical forest fund mentioned above that was announced by Norway and others in Davos, also announced it would focus on 'jurisdictional' projects.

Despite such changes in terminology, the authors of 'Promising Change, Delivering Continuity' say that in practical terms, REDD+ – like previous 'conservation fads' – above all stands for "continuity and repetitiveness in terms of the initial promises and expectations leading to substantial donor financing, pilot project activities, and policy development and implementation processes." The authors also say that REDD+ promises and expectations "have achieved little in terms of changing actual forest management and use on the ground outside selected pilot project sites, but have sustained the livelihoods of actors within the development and conservation industry, including academics.

It is unfortunate that those responsible at the European Investment Bank, the Green Climate Fund or in the governments of Norway and Germany keep ignoring the growing evidence showing that if the goals are reducing forest loss and tackling the root causes of climate change, continued funding for REDD+ is counterproductive. That evidence will not change just because the conservation lobby has succeeded in having REDD+ mentioned in the UN's Paris Agreement, or banks and governments keep pouring more money into new regional, 'jurisdictional' REDD+ initiatives.

The 'Promising change' article concludes that REDD+ above all is "a discursive commodity that is carefully promoted in particular ways that allow actors within the development and conservation industry access to financial resources." Because there are still many who look to REDD+ in the hope of addressing global climate change and protecting forests and forest peoples' rights, the authors urge a questioning of the uses of funding allocated to REDD+. Add to that the severe restrictions, criminalization and tenure insecurity for forest peoples and traditional forest users affected where REDD+ projects are implemented (2), it is time to replace the failed REDD+ experiment with support for the struggles and initiatives of forest peoples and traditional forest users who have protected forests for generations. Several studies have shown that where indigenous peoples' territories are recognized and demarcated and where the rights of traditional forest communities are respected, deforestation rates are lower than in surrounding areas not under control of indigenous peoples or traditional forest communities. # REDD and Rights: The Good, the Bad and the Ugly

[From WRM Bulletin 234, November 2017](#)

**The proposal to include forests in the UN climate negotiations is now 10 years old. Since then, the issue of human rights and the rights of indigenous peoples, women, local communities, and others, has been an interplay of actors, scripts, stages, casts and comedies. But above all, special effects and makeup have prevailed.**

The foundation of critical thinking, then, is in the dissent of the existing state of things and the search for alternatives, drawing from characterizations of the present situation, whose causes can obviously be located in the past” (1)  
in memoriam Hector Alimonda

The proposal to include forests in the UN climate negotiations is now 10 years old. Since the 2007 climate conference in Bali, Indonesia—within the framework of moving forward with the REDD+ mechanism—the issue of human rights and the rights of indigenous peoples, women, local communities, and others, has been an interplay of actors, scripts, stages, casts and comedies. But above all, special effects and makeup have prevailed (2).

## The Good

We must recognize that it is a good thing that there have been efforts in recent years to address the issue of peoples’ rights in the face of a problem as serious as climate change. Those of us who have been raising our voices for twenty years, demanding real solutions to global warming—such as leaving fossil fuels in the ground—always invoke the rights of people where these resources are extracted, the rights of communities where projects have been applied under the Clean Development Mechanism (CDM) or other carbon offset mechanisms, and also the rights of nature.

Thus, since REDD+ began to be discussed in climate negotiations, many organizations—especially at the international level—pushed to include the rights of indigenous peoples. This pressure eventually led to the proposal “No Rights, No REDD+,” in December 2008. However, these just demands took another course in the following years.

One example is the right to territory—a collective right that people have been demanding for decades—and in particular the one on land and territorial titling. Although the latter is a right that is foreign to the customary practices of demarcating and organizing their territories, it has been necessary to demand it in front of the forceful incursion of States. In this context, the REDD+ mechanism and REDD+ programs at the national level are clearly distorting this essential right of

peoples. Because for carbon trading to work, collective property must be assigned a private use; since it must be clear who owns what, how much, where and to what extent. The buyers will own a property title to the carbon found in a certain amount of land covered by forests, which is demarcated and titled. In this case, land titling is thus being promoted and used by carbon traders to give buyers a guarantee of ownership of the carbon contained.

Hence, the good news that human rights and the rights of peoples have been included in the basis of measures addressing climate change has been corrupted.

## **The Bad**

Those who have dominated climate negotiations—from corporate actors, financiers and even conservation NGOs and hegemonic government representatives—understand and take on the issue of rights in a totally different way than indigenous peoples and other local communities. Human rights and the rights of nature have been subjugated to capital and to so-called business and financial rights. The lobbying and business deals that coopt climate change summits have ensured that corporate interests prevail over common sense, under the narrative that they are the superheroes saving the planet. This raises a clear conflict about rights, as money—in the form of capital—has become a subject with rights, above humans and all forms of life.

The Paris Agreement, signed in the COP21 climate negotiations in 2016, features a new scenography but with the same protagonists. Among other drawbacks, it ratifies the inclusion of forests “to conserve and enhance, as appropriate, sinks and reservoirs of greenhouse gases.” (Article 5) These will deepen the loss of peoples’ rights at the local level, and—with the possibility of offsetting emissions through REDD+ projects—will increase the extraction and burning of oil, gas and coal, thus deepening climate change. In the best style of *Comedie-Française*, with its permanent troupe of actors, the Paris Agreement perpetuates the distribution of pollution quotas amongst those who pollute most; and it also perpetuates the possibility of conducting a global business, not only among companies but also among States.

Under the Paris Agreement, the logic of using forests to offset pollution has a planetary impact. Although REDD+ includes forest plantations, agriculture and soils—that is, any vegetation or soil that may contain carbon—it focuses mainly on the forests in Africa, Asia and Latin America, which are mostly under indigenous peoples’ collective ownership systems, and for this very reason, are the largest and best cared for forests.

REDD+ turns indigenous peoples and nature into permanent providers of environmental or ecosystems services. So we can say that REDD+ not only contributes to further loss of peoples’ rights and worsens climate change, but it also violates the rights of nature. REDD+ subjects nature to processes of slavery, servitude and appropriation of its work (in the same way that happens with peoples), by converting its biological cycles, functions and the recreation of life and reproductive cycles into work and goods that can be bought and sold.

## The Ugly

One of the objectives of REDD+ promoters is to try to reduce resistance to project implementation in mainly indigenous territories; and they try to win over local organizations so that the REDD+ mechanism is well looked upon and accepted.

Thus, as if by a special cinematic effect, human and peoples' rights in climate negotiations have been vanishing or undergoing metamorphosis. Rights became standards. The rights of women became voluntary safeguards; other rights became "participation and involvement in reporting and monitoring"; collective and territorial rights became "forest governance"; and the protection and enforcement of rights became merely promoted or something that "will be taken into account." Rights became "establishing operational models to comply with safeguards and consolidate the co-benefits," that is to say, "non-carbon benefits," as stated by Indigenous REDD+, an international initiative managed by the Coordinator of Indigenous Organizations of the Amazon Basin (COICA) (3).

In essence, the inclusion of human rights in REDD+ is nothing more than makeup so that it looks pretty—to try to stop peoples' rebellion and hide the truth behind these projects.

In light of this, we must protect peoples' rights to resist, to say NO to carbon offset projects, to not be displaced, to not have restrictions on their access and traditional use of their territories, to not be used so that oil or mining companies can violate another community's rights in another part of the planet and to not be manipulated so that the machinery keeps working.

## Epilogue

To conclude, we must further define what we mean when we say rights.

Even though rights are inherent to subjects—human and non-human—they are not static. Rights are a process: in historical, political, social and natural terms. They are a matter of dignity and they emerge as a reaction to oppression, discrimination, or the loss of livelihood. They are an ideal to attain, and they are not granted by the United Nations, let alone by the World Bank or transnational conservation organizations.

REDD+ assumes that rights are a reality that has already been achieved, conferred by the operators of this kind of project, and it distorts them by considering them to be a matter of governance, bureaucracy or institutional engineering. It also perverts rights because it "universalizes" them within a framework of Western capitalist modernity. Today, due to historical and political circumstances, rights are imbued with cultural and natural pluriversality.

When the concept of rights is part of climate negotiations, as in the REDD-rights pairing, it prioritizes benefiting the free market, meanwhile nullifying the cultural and political contexts of the villages and peoples where these kinds of projects or programs are carried out.

The proposal to include rights in REDD+ should have demanded the real practice of collective rights. These rights, according to Mexican Enrique Leff, are

nourished by the “rights of the cultural being to build diverse worlds of life,” by the “rights to reinvent their cultural identities,” or by the rights “to reconstruct worlds of life and design possible futures.” (4) REDD+ clearly prevents the exercise of these rights.

## Envira REDD+ project in Acre, Brazil: Gold certificate from carbon certifiers for empty promises

[From WRM Bulletin 237, April 2018](#)

**A rubber tappers community, part of a 40,000-hectare REDD+ project, faces a difficult struggle to maintain their way of life. The project has already sold carbon credits, yet to date only provided the local community with dental kits and a visit to the dentist.**

The ‘Envira Amazonia Project’ is one of three forest carbon (REDD+) offset ventures that the US-based company CarbonCo LLC is pursuing in the Brazilian state of Acre. The project area covers almost 40,000 hectares of Amazon rainforest, and is part of a massive 200,000 hectare property claimed by the company JR Agropecuária e Empreendimentos EIRELI. That claim, however, is disputed. Rubber tapper families have been living on the land for generations but most have been unable to obtain legal title documents that confirm their rights to the land. The REDD+ project threatens the future of the community because it imposes restrictions on the future use of the land and prevents reactivation of peasant farming plots abandoned in the last decade.

The main owner of the Brazilian company involved in the Envira Amazonia REDD+ project is Duarte Jose do Couto Neto. Do Couto Neto is involved in a number of enterprises (1), and was candidate for the ultra-right Prona party in Acre in the 1990s. As recently as September 2017, he expressed his support for the current presidential candidate of the ultra-right in Brazil, and the military dictatorship stating that he was longing for the military regime (“Saudades e muita do regime militar”). (2)

Like in most parts of the Brazilian Amazon, land tenure within the project area is complicated and disputed, but you would not know that from reading the project or certification documents: the land owner’s claim to a massive 200,000 hectares is taken for granted and no disputes over land are mentioned. Nor do the auditors who approved the Climate, Community and Biodiversity (CCB) certificate question how one person, in this case, Duarte Jose do Couto Neto – was able to legally acquire such a vast expanse of privately held land in relative proximity to the country’s border area with Bolivia and Peru. Rubber tappers have used the land for generations and therefore, have legal rights to the land they occupy. Yet, very few families hold land titles. Approximately 10 rubber tapper-turned-peasant families hold land titles inside the almost 40,000 hectares that make up the Envira Amazonia REDD+ project. In addition, around 40 families live inside the surrounding area but outside the REDD+ project site. According to project documents, the REDD+ project claims to protect the entire 200,000 hectares and suggests these communities outside the project area also as beneficiaries but does not explain why or how they are involved or affected.

In 2015, the Envira Amazonia REDD+ project was certified under the Climate,

Community and Biodiversity (CCB) standard by the Rainforest Alliance's Brazilian partner, Imaflora. The assessments for the Verified Carbon Standard (VCS – now called Verra) certification were carried out by Environmental Services Inc. (3) In 2016, the certifiers issued the first batch of carbon credits from the project, a second batch of carbon credits was issued in November 2017. (4) The VCS database shows that during 2016/2017 at least 750,000 carbon credits from the Envira Amazonia REDD+ project have been sold. (5)

### **Community unaware that the project is already selling carbon credits**

When the World Rainforest Movement (WRM) visited families living within the almost 40,000 hectares of the Envira Amazonia REDD+ project site in March 2018, community members were unaware that the project had been 'approved' and was selling carbon credits already. Residents explained that many foreigners had been to the area in the previous years, but few had spoken to them and many did not seem to speak Portuguese. They had carried out studies and one person had been visiting each family individually to convince them to support the carbon project.

Most families had signed a form suggesting support for the project or had been photographed when receiving a dental kit. This dental kit contained a small tube of toothpaste and a toothbrush, and has been, along with the offer of a gratis visit to a dentist the only tangible benefit that community members have received to date.

### **(Empty) Promises the basis for issuance of CCB Gold Level certificate**

While residents have not seen any tangible benefits beyond the dental kit and a one-off visit to the dentist, many promises were made when the project was presented to the families. Residents confirmed that the promises made are in line with those mentioned in the project document prepared for the CCB certification: “the landowners will also implement numerous activities to assist local communities and mitigate deforestation pressures such as: offering agricultural extension training courses; beginning patrols of potential deforestation sites in the early stages of the Project; granting land tenure to local communities; and establishing alternative economic activities including commercializing the collection of medicinal plants and açaí.” (6)

Imaflora granted a 'Gold Level' CCB certificate to the Envira Amazonia REDD+ project in 2015 / 2016, based on the project developer's promises to the community. Yet, none of these promises have been fulfilled. As mentioned above, the project owners seem to not even have informed the community that the REDD+ project had passed the certification assessments and was already selling carbon credits. Advertising for the Envira Amazonia REDD+ project also highlights the benefits the project supposedly brings to the community. A carbonfund.org advert for the project, for example, claims that the community is benefitting from the REDD+ project: “Social projects and activities to mitigate deforestation pressures and benefit the local communities include, but are not limited to: agricultural

extension training courses; boat patrols of potential deforestation sites; improving local schools and health clinics; and developing local infrastructure to collect, transport and sell locally-sourced açai, medicinal plants and rubber.” (7) Pictures of children in front of the community school (which has not been operational for the last two years and is in a poor state) and a picture of a community meeting inside the school building are included to suggest a project that is beneficial for the local community.

### **Envira Amazonia REDD+: Restrictions, not benefits, the reality for families**

While project owners and certification bodies create a virtual reality of the Envira Amazonia REDD+ project benefitting families in the project area, the reality for the community on the ground is similar to that faced by communities affected by the other two CarbonCO LLC REDD+ projects in Acre: the Purus and Valparaíso / Russas REDD+ projects. (8) A large-scale land owner with questionable land title takes advantage of the insecure tenure situation and isolated location of the community and uses his position of power over the families to impose land use restrictions that are likely to accelerate a rural exodus.

The Envira REDD+ project prohibits use of the forest by rubber tapper families outside the 150 hectares currently available to each of the families living inside the REDD+ project site. Residents are thus not allowed to reactivate recently abandoned plots that were used by rubber tapper families as late as the 1990s. This will force youth who have grown up in the area and wish to continue their parents’ way of life as rubber tappers and peasant farmers to leave the land and migrate to the city where employment opportunities will be scarce. Deforestation for cattle ranching continues to be pursued in the surrounding areas by large-scale land owners, yet rubber tapper and peasant families are denied the land that has been used for generations for rubber tapping and peasant farming.

The virtual reality of a REDD+ project providing ‘Gold Level’ community benefits, that advertises on the carbonfund.org website and certification reports create is in sharp contrast to the reality of empty promises and future land use restrictions that characterize the Envira Amazonia REDD+ project on the ground.

**Jutta Kill**, jutta [at] wrm.org.uy

Member of the International Secretariat of WRM

(1) A partial list of companies and properties in Acre and Mato Grosso that is apparently monitored as part of the REDD+ project certification (to prevent so-called leakage, i.e. the owner just moving cattle ranching to these other properties) is included in the certification documents. Several of the properties (e.g. Seringal Canada) listed form part of the massive 200,000 hectare land holding of which the REDD+ project is part. However, the list appears to be incomplete and not include activities in the Amazonas state which several residents of the area referred to. At least two companies that list do Couto Neto as Partner are not on the list: Santa Cruz Da Amazonia Empreendimentos Ltda and Start Up Da Amazonia Projetos De Exploracao Sustentavel Ltda Me.

(2) Comment Duarte Jose do Couto Neto to article ‘General do exército bate forte no STF’

(3) Financial reports of the non-profit organisation Carbonfund.org show a payment of USD

136,802 in 2015 to Environmental Services Inc. The reports do not explain whether this was the cost of validation and verification of the Envira Amazonia REDD+ project to the VCS carbon standard. # REDD Alert!

## How REDD+ projects undermine peasant farming and real solutions to climate change

[From WRM Bulletin 219, October 2015](#)

**Agriculture is increasingly being discussed at high level forums on climate change that promote initiatives which they claim will help farmers to adapt to climate change and reduce agriculture's greenhouse gas emissions. One such initiative is REDD+. REDD+, however, reinforces the corporate food system that is largely responsible for climate change, has robbed many communities and forest peoples of their territories and undermines the food and agricultural systems of peasants and indigenous peoples that can in fact cool the planet.**

Agriculture is increasingly being discussed at high level forums on climate change that promote different programmes which they claim will help farmers to adapt to climate change and reduce agriculture's greenhouse gas emissions. These initiatives are heavily influenced by corporations and governments that want to protect industrial agriculture and corporate food systems from real solutions to climate change that would provide peasants with more lands and support agro-ecological farming for local markets. As a result, small scale peasant agriculture is being targeted by a number of aggressively promoted false solutions to climate change while industrial and corporate-driven agriculture mostly continues with business as usual. One such programme is called REDD+.

A recent [publication from GRAIN and the WRM](#) explains some of the patterns that make Reducing Emissions from Deforestation and Forest Degradation (REDD) a danger for peasant farming. The publication explains how REDD+ reinforces the corporate food system that is largely responsible for climate change, has robbed many communities and forest peoples of their territories and undermines the food and agricultural systems of peasants and indigenous peoples that can cool the planet.

In most cases, the information peasant communities receive about REDD+ projects is biased or incomplete. Many promises of benefits and employment are made by project proponents if the community agrees to the proposed REDD+ activity. But the majority of REDD+ activities limit the use of the forest for shifting cultivation, gathering and other subsistence use. Hunting, fishing, grazing or cutting some trees for construction of housing or canoes are also often restricted and the restrictions are enforced by REDD+ project owners, often with the support of armed guards. Furthermore, most communities are not informed that these projects generate carbon credits, or that the buyers of these credits are some of the largest corporations worldwide, whose businesses are built on fossil fuel extraction and the destruction of territories of traditional communities. Peasant farming is thus singled out as the cause of deforestation while the major drivers of deforestation are ignored. At the same time, large-scale drivers of deforestation like industrial logging, expansion of oil palm, soya or tree plantations, infrastructure

mega-projects, mining, large hydro-dams – and above all, industrial agriculture expanding into the forest – continue without restriction (See [“REDD: a Gallery of Conflicts, Contradictions and Lies”](#)).

## **Some patterns that make REDD+ a danger to peasant farming**

### REDD+ blames peasant farming practices for deforestation and emissions

Peasants around the world are being squeezed onto less land while still managing to produce most of the world’s food, without nearly the amount of GHG emissions produced by large-scale industrial farms. The overwhelming majority of REDD+ projects, however, seek to reduce GHG emissions by further reducing the lands that peasant farmers and indigenous communities have access to or by changing how the land is used by peasant farmers.

REDD+ proponents have the erroneous assumption that shifting cultivation in particular, a practice commonly used by forest peoples around the world, is a major cause of deforestation. This is simply not true. What is usually lumped together under the term “slash-and-burn” in reality are hundreds of different land use practises, adapted to the local circumstances. Far from causing large-scale forest loss, these practises have allowed forest-dependent communities to maintain the forests they depend on. Where shifting cultivation is leading to forest degradation, rotation cycles are usually shortened because less land is available for shifting cultivators. This is almost always a result of expanding industrial plantations or mega-infrastructure projects or industrial logging, which grab land peasant communities rely on for food production.

Another argument used by REDD+ proponents is that the “opportunity cost” is lower than it is with restricting the expansion of plantations and industrial farms. The “opportunity cost” is a measure of the economic value that would have been generated, by companies or peasants, if deforestation activities were allowed to continue. The consultants can see the money that plantations generate for companies; but they do not see the whole value that forest areas represent for peasant communities in terms of local food production, housing, medicines, biodiversity, culture, etc. For REDD+ proponents, therefore, it is more “cost” effective to stop peasants from using forest lands than it is to stop plantation companies and corporate farmers.

### REDD+: Good business for carbon companies, international conservation NGOs, consultants and industrialized countries

One of the big promises of REDD+ is that forest-dependent communities and peasant farmers will get paid for protecting the forest. To entice governments and communities of the South, REDD+ proponents routinely make exaggerated claims about the size of the global trade in carbon credits – or the expected size of a future forest carbon market.

The reality is that the price for carbon permits has been in free fall since 2008. And while carbon permits might swing back to the expected price, the experiences of existing REDD+ projects that sell carbon credits show how most of the supposed profits that are in theory going to communities will be captured by others.

Before a REDD+ project can sell carbon credits, a lot of technical documents have to be written, certified and verified by different auditing firms. All of these preparations cost money. And they are not cheap. They add up to what is called the 'overhead costs' or 'transaction costs' of REDD+ projects.

For international conservation groups like The Nature Conservancy, Conservation International, and WWF by contrast, REDD+ is good business because they are able to capture a large portion of the international aid and climate funding available for REDD+. They are involved in many REDD+ projects and initiatives and act as advisors on national REDD+ plans. None of these groups have revealed the size of their REDD+ budgets, or how much of their funding comes from the climate finance that industrialised countries account as REDD+ payments to the global South.

Industrialised countries also stand to gain even more from REDD+ if the new UN climate treaty currently being negotiated provides them with the possibility to take the credit for tropical countries reducing deforestation. One of the proposals on the table is that the countries providing financial support for REDD+ count REDD+ reductions towards their own emission targets – a very convenient option for governments in industrialized countries seeking ways to avoid deep emissions cuts at home.

#### REDD+ undermines food sovereignty

There are different ways that REDD+ projects commonly undermine local food production and create food insecurity among local communities. In some cases, families participating directly in the offset project must reduce their production of food crops in order to plant trees for the project. In other cases, the REDD+ project prevents the communities from accessing forested areas that they rely on for hunting and gathering, for shifting cultivation or for grazing.

The regular failure of REDD+ initiatives to 'establish alternatives to slash-and-burn' or 'modernise' peasant agriculture through proposals developed by far-away project owners or conservation NGOs points to another tension inherent in REDD+: these projects are concerned first and foremost with maximizing carbon storage in the area that will deliver carbon credits. Initiatives to involve peasant communities and forest peoples are an afterthought, a requirement from donors or to show supposedly participatory project implementation.

#### REDD+ undermines community control over territories

Tradable REDD+ credits are a form of property title. Those who purchase the credits do not need to own the land nor the trees that are "storing" the carbon, but they do own the right to decide how that land will be used. They also usually have

contractual rights to monitor what is happening on the land and request access to the land at any time they choose for as long as they own the carbon credit.

Communities often are not informed about how the contract they sign for REDD+ projects might undermine their control over their territories. Often, obligations that communities or families enter into are not clearly explained or they are described in ambiguous terms that can easily be misinterpreted. Seeking legal advice on such complex and ambiguous technical documents is made difficult because almost all REDD+ contracts contain strict confidentiality clauses.

Another important way that REDD+ projects affect community control over territories is by creating divisions within communities. While many promises of employment through REDD+ projects remain unfulfilled, REDD+ projects generally do hire people from within the community to work as forest rangers or guards whose role it is to report on compliance with REDD+ project rules within the community. In other words, they are expected to keep an eye on other members of the community. Their role is to report to the project owners if community members cut down trees, hunt, fish, grow food crops in the forest or use the forests as they have always done but which is forbidden under the REDD+ project rules. This form of 'employment' creates divisions within the community that will negatively affect the ability of communities to organize and work together to defend their territories.

### **How changes in the law inspired by carbon markets are threatening agrarian reform**

Forest Code in Brazil is an example for how legal changes informed by REDD+ and similar offset trading initiatives pose a risk to agrarian reform and peasant rights to land. The 2012 revision of the Forest Code extends the use of tradable forest restoration credits. These are credits that a landowner can sell if s/he has cleared less forest than allowed under the Forest Code. Farmers who have in the past cleared more forest than the law allowed and are obliged under the 2012 Forest Code to restore the area cleared in excess of the legal limit – or risk losing access to agricultural credit lines – can buy these forest restoration credits instead of restoring the forest on their own land.

These tradable forest restoration credits put a key instrument for Agrarian Reform in Brazil at great risk. The historical instrument of Agrarian Reform has been the expropriation of latifúndios that could be shown to be unproductive and thus not fulfilling the constitutionally required “social function” of the land. The introduction of tradable forest restoration credits created an instrument that could shield owners of latifúndios from expropriation for social purposes because these credits would transform unproductive estates into carbon factories and repositories of environmental reserves. This in turn would allow land owners to claim that the land is fulfilling the constitutionally required “social function”.

## REDD+ facilitates the expansion of corporate agriculture

The deforestation caused by the agriculture sector over the past few decades is almost entirely due to the expansion of commodity crops for export and for animal feed, with the vast majority of this expanded production on large-scale industrial farms and plantations. Deforestation is then directly linked to international commodity supply chains that are controlled by a small number of transnational food corporations. These include commodity traders and producers like Cargill, Louis Dreyfus Group, Bunge, Archer Daniels Midland (ADM), JBS or Wilmar International, food companies like Nestlé, Danone, or Unilever, and supermarkets and fast food chains like McDonald's, Walmart or Carrefour.

To shield themselves from bad publicity and to protect their supply channels, corporations have established voluntary certification schemes and commodity roundtables with the participation of a few large international NGOs (see separate article in this bulletin).

## **Conclusions**

The problems are clear, the solutions exist... and they are very different from the REDD+ concept.

REDD+ helps to conceal the fact that while agriculture is a major contributor to climate change, not everybody growing crops shares the same responsibility for the emissions. It is the industrial food system – with its heavy use of chemical inputs, its erosion of soils, its deforestation and its emphasis on production for export markets – which is the main source of greenhouse gas emissions.

Yet, REDD+ falsely blames shifting cultivation and peasant farming for deforestation and greenhouse gas emissions. In reality, peasants are already proving that it is possible to 'feed the world' while producing far fewer emissions than the export-led, industrial model of agricultural production. Giving lands back to small farmers and indigenous communities is the most effective way to deal with the challenges of feeding a growing global population in an era of unpredictable climate change. REDD+ is a dangerous distraction from urgent action in this direction.

# What is the biggest REDD+ contradiction?

[From WRM Bulletin 208, November 2014](#)

For years, a group of banks, corporations, governments and conservation NGOs have been attempting to show that REDD+ is a good mechanism for combating climate change. However, as WRM has sought to learn more about REDD+ and especially, the projects that have been implemented, what we have seen is a consistently failed mechanism that suffers from many structural contradictions. This article reviews some of the most serious contradictions of the REDD+ mechanism.

For almost ten years, a group of banks, corporations, governments and NGOs have been attempting to show the world that REDD+ is a good mechanism for combating climate change.

However, as WRM has sought to learn more about the REDD+ policies that have been designed over the years, and especially, the pilot projects that have been implemented, what we have seen is a consistently failed mechanism that suffers from many structural contradictions (you can find more information about REDD+ on the [WRM website](#)).

In spite of this, REDD+ will be a cornerstone of the new global climate agreement that the world's governments are discussing right now in Lima, Peru, and which is expected to be finalized in 2015 in Paris. The new agreement aims to increase financing from the World Bank and Northern cooperation agencies to change forest-related legislation in countries with tropical forests, in order to adapt laws to the market logic underlying REDD+.

Enough reasons for the WRM, together with a group of international organizations and networks, to make [a call to action](#), emphasizing the need to fight not only against REDD+, but also against the oil, gas and mining industries that particularly benefit from REDD+, as well as fighting against globalized capitalism.

This is also a good time to review some of the most serious contradictions of the REDD+ mechanism:

1 – On one hand, REDD+ promoters claim that local communities will not be negatively affected by REDD+ projects, since all projects will be implemented on the basis of the principle of free, prior and informed consent. On the other hand, the implemented projects for the reduction of forest carbon emissions have been designed and defined by technicians from the corporations/NGOs promoting the projects, without giving the communities the necessary and complete information and without consulting with them as to whether or not they wanted to turn their forests into forest carbon 'reservoirs'. To make matters worse, these projects tend to negatively affect food sovereignty, communities' control and autonomy over their territory, as well as local criminalization.

2 – On one hand, REDD+ promoters justify their projects by pointing the finger of blame at communities who depend on forests as the main drivers of deforestation. On the other hand, they downplay the true causes of deforestation and the role played by those who are really responsible, namely the corporations

and financial institutions behind the construction of hydroelectric dams, industrial agriculture, large-scale mining projects, oil and gas operations, etc. To make matters worse, these corporations are the ones who benefit most from REDD+ projects through the purchase of carbon credits and the fact that these projects allow them to 'greenwash' their public image.

3 – On one hand, REDD+ promoters tell the communities who live in the area of the project that 'protecting' the carbon in their forest will help to reduce greenhouse gas emissions and climate change impacts globally. On the other hand, they do not tell these same communities that the 'protection' of the carbon in their forest gives big polluting industries the right to continue emitting more carbon emissions into the atmosphere, and that this, in time, will exacerbate climate change to a much greater extent, with impacts on tropical forests as well. On the contrary, REDD+ promoters force communities – whose carbon emissions are almost non-existent – to change their ways of life, while the 'way of life' of big corporations in industrialized countries can continue unchanged thanks to REDD+.

4 – On one hand, REDD+ promoters allocate more than half of the money spent on projects to consultants to carry out more and more assessments of the amount of carbon that is supposedly stored today and in the future in the forest within the project areas. On the other hand, these assessments are not reliable, and even worse, they further distract attention from the real causes of global warming.

5 – On one hand, REDD+ promoters claim that reforestation, or rather, the planting of trees, can also be considered as a REDD+ project because it increases the world's 'forested' area and the 'conservation' of carbon stocks. On the other hand, this supposed reforestation is carried out through the establishment of large-scale monoculture plantations of eucalyptus trees to supply pulp mills, with industrial and mechanized production processes, a short growing cycle of six years, and heavy use of toxic pesticides and petroleum-based chemical fertilizers.

6 – On one hand, the promoters of REDD+ claim that agriculture can be 'climate smart'. On the other hand, their means for making agriculture "smarter" is through industrial agriculture that uses transgenic seeds planted in large-scale monoculture plantations with a heavy dependence on petroleum products.

7 – On one hand, an energy company from an industrialized country in Europe or North America that has bought carbon credits from a REDD+ project claims to have documents that prove its ownership of the carbon supposedly stored in a certain area of forest. On the other hand, this forest is thousands of kilometres away from this alleged 'owner' of the carbon, and the company knows absolutely nothing about the place where 'its' carbon is 'stored' or about the people who have roots in this territory that go back for countless generations.

8 – On one hand, the Norwegian government supports the Brazilian government with millions of dollars to reduce emissions from deforestation. On the other hand, that same Norwegian government has just announced that its state-owned oil company, Statoil, is going to drill new offshore wells off the coast of Brazil, which will even further increase the amount of carbon in the atmosphere, as well as increasing its profits – which greatly surpass the amount of money granted to 'reduce deforestation' to the governments of Brazil and other countries in the

South.

9 – On one hand, REDD+ promoters have succeeded in getting a lot of time and money spent on a secondary cause of climate change: deforestation and forest degradation. On the other hand, governments have spent little time and money on confronting the main problem. To make matters worse, this is not due to a lack of awareness and knowledge of what would actually solve the problem: leaving oil, gas and coal underground.

10 – On one hand, the promoters of REDD+ claim that it will only be possible to save the world's tropical forests by using mechanisms like REDD+ and establishing the monetary value of nature. On the other hand, for the communities who depend on forests, these forests have countless values that are beyond measure; it is impossible to put a price tag on something that indigenous communities consider sacred.

And now it's up to you to make the tough decision of choosing which one of these is the biggest contradiction of REDD+!

# REDD+ myth: Sustainable Forest Management

[From WRM Bulletin 207, October 2014](#)

The UN climate negotiations included the concept of ‘Sustainable Forest Management’ (SFM) in REDD+ during the 2010 agreements. SFM is one of the ‘+’ (‘plus’) parts of REDD. Under REDD+, SFM is promoted as a way of achieving emissions reductions. This is a myth. The reality is that SFM allows destructive and often illegal logging to continue with impunity.

**Myth:** Sustainable Forest Management will reduce forest emissions and bring sustainable development.

The UN climate negotiations included the concept of ‘Sustainable Forest Management’ (SFM) in the agreements of 2010 in Cancun, Mexico, under a concept called REDD+, “Reducing Emissions from Deforestation and Forest Degradation, the conservation, sustainable management of forests and enhancement of forest carbon stocks in developing countries” (1). Under REDD+, SFM is promoted as a way of achieving emissions reductions. The reality is that SFM is the myth that allows destructive and often illegal logging to continue with impunity.

Everyone these days practices ‘sustainable forest management’. Even Malaysian company Rimbunan Hijau, one of the world’s most destructive logging companies (2), claims on its website to practice ‘sustainable forest management’ and to “keep Malaysia green” with their “investment in tree plantations” (3). Companies keep pushing the idea that monoculture plantations can be ‘sustainable’. Rimbunan Hijau even claims to be “planting forests”. The UN itself also considers industrial tree plantations as forests. This is, simply put, a flagrant error. Plantations are not forests. Forests contain diverse webs of life and plantations are void of biodiversity and with polluted soils and water streams. This endangers Indigenous and forest dependent people and exacerbates climate change.

As Patrick Alley of the NGO Global Witness points out in a recent talk, ‘sustainable forest management’ is a “nasty little euphemism” (4). The logging industry has managed to portray itself as an almost philanthropic venture, bringing jobs and development. Alley explains that, “You can divide the industrial logging industry in the tropics into two categories: The criminal and the legitimate. The criminal is criminal. And the legitimate is much the same, but with better PR.”

The logging industry has had plenty of help in pulling off this perfect crime, as Alley describes it. Continued logging in the tropics has even been encouraged with taxpayers’ money. In the nine years up to June 2011, the World Bank poured US\$4.1 billion into the forestry sector. A 2013 review by the Independent Evaluation Group found that overall these projects have failed to address poverty or to benefit local communities (5).

Predictably, the Bank’s management rejected the criticism and the money from the World Bank keeps coming (6). In August 2013, the Bank announced that it was handing out US\$31.83 million for participatory ‘sustainable forest

management' in Laos (7). This is a country that has seen its forests devastated by illegal logging, which shows no signs of stopping before the last forest has been felled (8). Yet, rather than supporting initiatives to round up the criminals running the illegal logging, the World Bank is pouring in yet more money into little more than greenwash for continued logging.

A film on industrial logging in the Democratic Republic of Congo made by Global Witness showed the impacts of industrial scale logging with the back up of the World Bank and international donors (9). Again and again, communities told of exploitative companies, damage to their ecosystems and livelihoods, lack of benefits, and increasing conflict and violence. It is impossible not to see the contradiction between the programs of 'sustainable forest management' that claim to reduce deforestation and the social and environmental destruction caused by the logging industry in the DR Congo.

Recent research led by scientists from Lancaster University reveals that the impact of 'selective logging' and surface wildfires in the Amazon has been grossly underestimated. (10) The NGO Greenpeace calls logging in the Amazon "The Silent Crisis" as criminals launder illegal timber as legal with official documentation (11). Defenders of the 'sustainable forest management' claim that this can be accomplished by extracting only few tree species and leaving the rest of the forest 'standing'. However, although 'selective logging' sounds better than 'clear-cutting', in reality, bigger areas of forests are being affected. This has huge implications for REDD+ as SFM is one of the 'plus' parts of REDD.

Furthermore, another recent study in East Kalimantan exposed no difference in carbon emissions between Forest Stewardship Council (FSC) certified logging operations and conventional logging concessions. In 2009, FSC formed a Forest Carbon Working Group, which produced a "Strategic Framework for an FSC Climate Change Engagement" in November 2012 (12). One of these goals is that, "FSC is recognized by credible forest carbon schemes in order to facilitate and lead participants towards FSC certification." However, FSC has a controversial record (13), as a result of its certification of monoculture tree plantations and destructive logging operations, and its failure to hold its certifying bodies to account.

In 2011, professors Bradshaw and Laurence co-authored a paper titled "Primary forests are irreplaceable for sustaining tropical biodiversity", which was published in Nature (14). Laurence wrote in the ALERT website that, "Indonesia alone has at least 35 million hectares of selectively logged forest – an area larger than Germany – and much of this logged forest is unprotected and being cleared for agriculture" (15). Bradshaw also told in a recent interview that, "It's insane to consider 'lower-emission' logging at all considering the [intervened] forests, no matter the disturbance, are never able to retain as much carbon or biodiversity as primary forests" (16).

SFM can therefore mean the expansion and legitimacy of industrial-scale commercial logging operations in tropical forests.

Sena Madureira, Acre, Brazil. June, 2018. Ph: Friends of the Earth Brazil.

### 3. Resistance against the proposals to allow international forest offsets in the California carbon market, some examples

#### Brazil: Sena Madureira Declaration, June 17, 2018

**People from the forests gathered in Sena Madureira, Acre, to denounce the false solutions of green capitalism and demand their right to their lands. The Jaminawa's regain of their territory was celebrated as an example of the power of the peoples union.**

Published by [Friends of the Earth Brazil](#)

Between June 15 and 17, 2018, indigenous peoples and communities who live and work in the forest gathered in Sena Madureira, Acre, to denounce the false solutions proposed by green capitalism for environmental and climatic degradation – paradoxically caused by the capitalist logic of unsustainable production and consumption itself. Projects that believe in the fallacious principle that it is possible to continue polluting the earth, water and atmosphere in a certain point of the planet, while “compensating” for this pollution by maintaining forests in another, were denounced. Other than impossible, these measures also end up hampering populations that do relate to forests in a balanced way – indigenous and small local communities – who end up losing autonomy over their territories, their production capability and their subsistence.

The state of Acre is seen as a “laboratory” for these green capitalism “compensation” policies. There, traditional communities are suffering at the hands of these REDD, REDD+, REM or PES projects – a pack of complicated acronyms that stand for a group of even more complicated names: REDD stands for “Reducing Emissions from Deforestation and Forest Degradation”; REM stands for “REDD Early Movers”, and PES means “Payment for Environmental Services”. All that these acronyms and names have in common are its measures of green capitalism to continue to pollute freely, at the expense of the rights of indigenous and traditional populations, who, when deceived to accept such projects, lose their rights over their lands.

In sum, polluter governments and companies from the global north buy “pollution credits”, taking away from communities from the south their right to manage their own land: they buy the right to continue polluting by violating rights elsewhere, hence disregarding other peoples sovereignty over their territory. They privatise and financialise nature. They hinder local land usage, fishing and planting, thus hindering the survival of these people. They confuse communities with strange terms, making use of a language alien to people, and seduce them with

false promises – confuse to divide, divide to dominate: that is how green capitalism works. But in Sena Madureira, just as previously in Xapuri, the forest peoples revealed the antidote to these attacks: unite to resist, resist to set free.

As if to emphasize the importance of this meeting, while the dialogue took place in Sena Madureira, the aviation companies met in Montreal, Canada, to discuss those “compensation” measures, which in no way reduce pollution levels and which cause violations of rights in the territories where are implemented. The expansion of airports in the world and the highly polluting air industry has also been criticized, and is an example of how the “compensation” logic works: despite all the inflicted rights violations, companies maintain their “green speech” as if they were actually addressing the problems that they themselves create. In Porto Alegre, for example, Fraport, a German company that operates the local airport, plans to eject Vila Nazaré, which has been in the region for 60 years, so that it can extend the runway for a few hundred meters. The expulsion of people, as usual, occurs in a violent and arbitrary manner, without any transparency in the process – against the will of Vila Nazaré’s community. On the one hand, a community being expelled from its land for the expansion of an airport; on the other, populations losing the right to their territory due to “compensation” projects; in the middle, a destructive logic, where companies attack rights at all ends and harm the forest peoples and also the peoples of the cities – a logic against which these peoples rise.

Read below the full document produced at the meeting in Sena Madureira, attended by the indigenous Apurinã, Huni Kui, Jaminawa, Nawa, Nukini, Jamamadi, Manchineri, Ashaninka do Envira and Yawanawa, by representatives of traditional communities in the interior of Acre, by rubber tappers from Xapuri, among many organisations from various states (Amazonas, Mato Grosso, Rio Grande do Sul and Rondônia) such as Friends of the Earth Brazil, the Indigenous Missionary Council (CIMI), the Rosa Luxemburg Foundation and the World Forests Movement (WRM).

### **Sena Madureira Declaration, 17th of June, 2018**

We, the inhabitants of the forest, the rubber tappers, the Apurinã, Huni Kui, Jaminawa, Nawa, Nukini, Jamamadi, Manchineri, Ashaninka do Envira and Yawanawa indigenous people here present, the members of solidarity organisations from various states of Brazil (such as Acre, Amazonas, Mato Grosso, Rio Grande do Sul and Rondônia) and the university professors gathered from June 15 to 17, 2018 in Sena Madureira, Acre – ancestral land of the Jaminawa people – for the “Fourth Meeting of Capacity Building and Articulation of Forest Peoples in Confronting False Solutions”, hereby declare:

- We undergird the demands and denunciations of the Xapuri Declaration, in particular the rejection of green capitalism’s false solutions, such as REDD (Reducing Emissions from Deforestation and Forest Degradation), PES (Payment for Environmental Services), logging, as well as any measure of climate or environmental “compensation” through the purchase of pollution credits or similar;
- Committed to the Xapuri Declaration, we carry forward the spirit of unity

among peoples and the strength to face the “solutions” offered by capitalism to the crises caused by capitalism itself;

- The Jaminawa’s regain and occupation of their ancestral territories – Cayapucã, São Paulino and Caieté – serves as an example of this union’s power and strength to face the attacks of the capitalist muscle against the peoples. This victory invigorates and empowers each and every one of us – communities, peoples and organizations present – taking our common struggle forward;

- We emphasize the importance of the words of Pope Francis in the Encyclical *Laudato-Si* (paragraph 171): “The strategy of buying and selling “carbon credits” can lead to a new form of speculation which would not help reduce the emission of polluting gases worldwide. This system seems to provide a quick and easy solution under the guise of a certain commitment to the environment, but in no way does it allow for the radical change which present circumstances require. Rather, it may simply become a ploy which permits maintaining the excessive consumption of some countries and sectors.”

- Likewise, we highlight the condemnation of nature financialisation measures contained in paragraph 11 of the Declaration of the Alliance of Guardians and Children of Mother Earth (November 28, 2015), which says, regarding the primary forest areas of the planet which are traditionally under the care of indigenous peoples: “These ecosystems must not be used as part of a carbon market mechanism that quantifies and commodifies Mother Earth, branded as payment for ecosystem services, carbon trading, carbon offsets, carbon pricing, REDD, CDM, biodiversity offsets and financialisation of Nature; turning nature into “units” to be sold in financial markets.”

- We reject the REM (REDD Early Movers) program, funded by the German public bank KfW, which induces communities to accept the logic of green capitalism and uses the state of Acre, improperly, as an example of “success” in sustainable development. In fact, the program divides communities and threatens peoples’ autonomy over land use in their own territories, jeopardizing their food sovereignty and their traditional customs and knowledge. These same problems can happen in Mato Grosso, a state where recently the program has started being implemented;

- In addition, the money from these projects does not respond to the wishes and needs of indigenous and traditional populations, such as the demarcation of indigenous lands and land regularisation of small farmers in areas affected by measures of green capitalism. Even today there is no transparency on how such resources are applied, as we have already denounced in the Xapuri Declaration. We demand that Federal prosecutors hold projects accountable;

- We disallow any policy built within offices without prior consultation (in accordance with ILO Convention 169) and participation of indigenous and traditional populations. Any definition of measures that concern these populations must start from the bottom, from within the communities;

- We offer solidarity to the peoples of all the states of Brazil and the countries of the global South that suffer this same violence from green capitalism; we urge the peoples of the northern countries not to fall for the “green speech” tricks of companies, governments and NGOs and question financial investments such as the

REM program and the Amazon Fund, among others;

– We vehemently reject the persecution, defamation and criminalization of the defenders of the territories, who have the courage to express and denounce the attacks of the promoters of green capitalism.

Lastly, strengthened by the exchange of experiences among the most varied peoples during these three days, we continue to hold our heads high, believing that if we stand united, we have all the conditions to fight against the false solutions of green capitalism and to build alternative forms of sustainable life in the territories, respecting peoples' plurality. We invite all peoples of the forests and communities who suffer the violations of this inhuman and predatory system to, together with us, follow a path through which it can be possible to overcome the destructive logic of capital.

## **Brazil: Indigenous Peoples from Acre declare their rejection of REDD policies and their support to CIMI**

**Indigenous Peoples from Acre in Brazil declare their rejection of REDD policies and their support for the work carried out by the Indigenous Missionary Council (CIMI). Feijó, State of Acre, Brazil, September 28th, 2017.**

### **Letter of rejection and request for clarification**

We, indigenous peoples of four different ethnic groups, Shanenawa, Huni Kui, Ashaninka and Madiha, together with the colonheiros (small-scale peasants), seringueiros (rubber tappers), and riverside dwellers of the high and low River Envira, as well as the River Jurupari communities Santo Antônio, Paumaripé and Valparaíso, the rubber tappers associations MASSIPIRA and Novo Oriente, and people living along federal and state highways, gathered in Feijó on the 27th and 28th September 2017. We renounce the letter of accusation and persecution against the CIMI (Indigenist Missionary Council) published on 31st July on the CPI Acre website under the title “Open Letter in Response to Declarations about SISA, REDD+ and Indigenous Peoples in Acre”.

We declare that we are extremely grateful for the work they carry out in support of indigenous populations and communities, whereas we renounce any action against the indigenous populations’ welfare, taking into account that we are aware of the CIMI’s transparent work in relation to indigenous issues in the River Envira area and the whole of Brazil.

Through all the Brazilian bureaucracy, we, indigenous peoples and other traditional communities demand respect for our originality, humility and wisdom in recognising the true value of Amazonia in and for our lives. For this, it is extremely necessary for everyone to know that we, indigenous peoples, were very happy before the arrival of the Portuguese in our country of origin, Brazil. We are aware that we have many rights, as we have duties, which have to be exercised. However, we know that things have to happen with transparency and honesty.

We, indigenous peoples, demand that legal accounting be carried out of all resources of any kind destined to our indigenous and riverside communities, with the aim of improving the relationship between the state authorities and members of the communities.

We take great care of preserving human life, for we preserve the environment as part of our way of life; we are aware that all we need to survive with our families in harmony is that our lands are demarcated so we can plant and gather our traditional food, and that our governing authorities work with transparency regarding indigenous issues. We realize that lack of honesty has existed since the times when Pedro Alvarez Cabral traded gold for a piece of mirror; ever since those times, authorities haven’t found the true essence of governing with honesty and transparency and in good faith.

Feijo, September 28th, 2017

## Motion of rejection and solidarity with local leaders facing threats in Acre, Brazil

More than 80 organizations and individuals from all over the world sent today the letter enclosed below to relevant authorities in Brazil, Germany and California / USA rejecting “any and all attempts to intimidate or censor people and organizations that critique and oppose the environmental and climate policies implemented by the Acre government.”

In the letter the organizations and individuals reaffirm their “solidarity with all those who suffer threats or retaliation because of their firm political stance to defend their territories against the incessant exploitation of capital: You are not alone!”

## **Motion of rejection and solidarity with local leaders facing threats in Acre, Brazil**

From May 26-28, 2017, a gathering was held in Xapuri, in the state of Acre, Brazil, around “the effects of environmental and climate policies on traditional peoples.” In addition to the publication of the [Xapuri Declaration](#), videos were disseminated with statements from indigenous leaders, seringueiros (rubber tappers) and other participants at the event. Since then, many of those leaders have been pressured and threatened by the „owners of power in Acre“.

Outraged by this latest aggression against the rights of peoples and communities that live in and depend on forests, those of us who participated in the aforementioned gathering—and those who support Amazonian peoples and communities’ struggles—express our vehement rejection of any and all attempts to intimidate or censor people and organizations that critique and oppose the environmental and climate policies implemented by the Acre government.

We specifically denounce and reject attempts by the Acre government, and non-governmental organizations associated with it, to slander such critics—in particular their claim that critics’ questioning could make it impossible to receive resources that could benefit the people of Acre’s forest. We know that the government has sufficient resources to protect the rights and serve the true interests of indigenous peoples and local communities. There is no need to put these peoples and communities’ futures at risk through questionable and nebulous projects. The government must act transparently in investing the resources it has already received through such projects, disclosing who the true beneficiaries are.

We demand that the National Indian Foundation (FUNAI) cease to intimidate officials who participate in these civil society discussions and meetings. We also demand that FUNAI fulfill its mission, which is to protect and promote the rights of indigenous peoples. With its intimidations, FUNAI is once again harming these indigenous people’s rights to free expression.

We understand that, as the bankruptcy of the underlying model of the environmental and climate policies and projects in question becomes more obvious, those whose private interests are intertwined with such policies and projects tend to defend them in increasingly repressive and violent ways. As the philosopher Paul Valer once said: “He who cannot attack the argument attacks the arguer.”

We cannot tolerate these continued attacks! That is why we reiterate our support for the Xapuri Declaration. We reaffirm our solidarity with all those who suffer threats or retaliation because of their firm political stance to defend their territories against the incessant exploitation of capital: You are not alone!

## Xapuri Declaration, May 28, 2017

We, forest dwellers, rubber tappers, Apurinã, Huni Kui, Jaminawa, Manchineri and Shawadawa indigenous people, members of supportive organizations and the Jesuit Travelling Team, teachers from different universities, united in the city of Xapuri in the Brazilian state of Acre from 26 to 28 May 2017, at the meeting “The effects of environmental / climatic policies on traditional populations”, declare:

– That, at this moment of resurgence, we are unifying the struggles of indigenous peoples and rubber tappers in the same cause. Our union is our main weapon against capital.

– That, aware of the history of resistance of the forest peoples and the legacy of Chico Mendes, we will stand firm in the defense of our territories. Like the ones that preceded us, we will continue to oppose attempts to expropriate our ways of life. We demand the demarcation and recognition of our rights to land and territory.

– We reject the ongoing initiatives materialized in policies that aim to convey our territories to private capital groups, including ranchers and loggers. We are concerned about the lack of transparency and the way that different mechanisms have been put forward, including payments for environmental services such as REDD and its variations, unsustainable forest management plans and mechanisms foreseen in the new Brazilian Forest Code, many of which are imposed through intimidation, blackmail, negotiations under false pretences and with bad faith.

– We express our indignation about the false solutions, which legitimize the continuity and expansion of a socially and environmentally destructive model. We reject initiatives to offset pollution. We do not accept mechanisms based on restrictions on our way of life, and we express solidarity with people living in the areas that are contaminated by companies seeking compensation (offsets). We stand by the people from other countries who live in the areas impacted by the pollution generated by destructive companies. No one should live in contaminated areas; it is time to end all kinds of racism, including environmental racism.

– We are being harmed by the arrangements and negotiations between the government of Acre and other states and countries in favor of corporations eager for pollution credits, including oil and mining companies, loggers and agribusiness companies. We are concerned about ongoing talks about aviation emissions compensation through Reducing Emissions from Deforestation and Degradation of Tropical Forests, the so-called REDD mechanisms. We refuse to use the term carbon credits, understanding that they are actually pollution credits, which aggravate rather than solve the problem. We reject any form of climate colonialism.

– We express total solidarity with women and men who, forced to fulfill impossible prerogatives, get fined, criminalized, indebted, without conditions to maintain their ways of life, trapped in schemes that refer back to semi-slavery and debt bondage of rubber tappers in colonial times. We also express solidarity with the residents of the rubber tree areas Valparaíso and Russas, who, coerced to submit to a REDD project, are threatened with expropriation of the lands that are

rightfully theirs.

– Solidarity to the native community of Nova Oceania, of the Upper Tauhamanu River, in the municipality of Iberia, Peru. Our brothers and sisters Pyru Yini and other communities in isolation face the advance of deforestation, driven by timber concessions, which rely on the direct participation of businesspersons from Acre and others. These groups are involved in REDD projects and, while brokering international agreements with the support of Brazilian authorities, maintain predatory practices. We share the complaint that a village was destroyed, with 18 houses burned, in July 2014, with absolutely no action taken by the authorities, in an episode stained by impunity.

– We call on other rural and urban working people to reject this destructive pattern, marked by inequality and violation of the rights of indigenous peoples and traditional communities. We reiterate our unity in the struggle and willingness to resist to the end. Chico Mendes lives, not in the actions of governmental marketing, but in the struggle of the forest peoples.

## REDD – Brazil: Open letter from Acre challenges legitimacy of REDD+ “consultation” in California

Organizations and individuals in the state of Acre and other states in Brazil sent an open letter this month to the governor of California and the California REDD Offset Working Group, challenging the legitimacy of a “consultation” carried out – through three workshops in California and over the internet, in English – regarding the inclusion of REDD offsets, primarily from Acre, in California’s carbon trading scheme. As of April 30, 2013, the working group will consider this “consultation” to be concluded and will submit its recommendations to the government of California.

The initiative to include REDD offsets in California’s cap-and-trade system stems from an agreement signed in 2010 by the governors of California (USA), Acre (Brazil) and Chiapas (Mexico), under which Acre and Chiapas would “supply” carbon offset credits generated by REDD+ projects, while polluting industries in California would benefit from these credits by purchasing the “right” to continue polluting.

The open letter from Acre and Brazil stresses, first of all, that this entire process is illegitimate: “As organizations and activists based in Acre and Brazil, (...) we are writing to you to express our opposition to the proposal of the government of the U.S. state of California to ‘reduce’ its CO<sub>2</sub> emissions through the acquisition of REDD+ offsets from the states of Acre and Chiapas, instead of pursuing emissions reductions in California itself. In addition to our opposition to this proposal, we also challenge the legitimacy of the ‘consultation’ process underway in California with regard to this matter, due to the lack of effective participation by the communities in Acre and Chiapas who depend on the forests to maintain their way of life and will be directly affected by this REDD+ proposal.”

The open letter also emphasizes that the “green” image presented to the world of Acre as a model of “sustainability” and of how REDD+ projects can be carried out in tropical rainforests – often using the figure and ideals of Chico Mendes to back up this image – is in fact a far cry from the reality in the state. “REDD+ will not effectively reduce global carbon emissions, and much less the destruction of the world’s forests; it deepens existing social and environmental injustice; it criminalizes the traditional practices of forest peoples and communities; and it is a profoundly neocolonial initiative.”

The letter recommends that the government of California cancel the illegitimate consultation process currently underway, “unless it undertakes, in the near future, a wide-reaching consultation with the parties affected in the territories from which it plans to obtain REDD offset credits.”

A large group of international organizations and individuals have endorsed the open letter and have sent a statement of solidarity, which declares: “Decisions regarding REDD+ legislation or programmes already do and will in future affect forest peoples’ way of life. Given that such meaningful participation was absent from REDD+ processes in Acre or during the elaboration of recommendations to

the government of California in this matter, we urge you not to include REDD offset credits into the California carbon trading scheme.”

The statement continues: “We also share the additional concerns on the REDD+ mechanism and support the demand made in the Open Letter that California should not include REDD offsets credits from Acre in its carbon trading scheme, and rather engage in efforts to reduce emissions at home.”

This REDD+ project covers almost 70,000 hectares and has sold carbon credits to offset programs advertised by at least two airline companies: Delta Airlines and TAP. Yet, behind this is an increase in deforestation in the region, a history of land grabbing, the use of certifications that no longer exist and unfulfilled promises to local communities.

### **About the World Rainforest Movement (WRM)**

The World Rainforest Movement is an international initiative set up in 1986 by activists from different countries to facilitate, support and reinforce the struggle against deforestation and land grabbing in countries with forests and forest-dependent communities. In a gender sensitive way, it aims to assist communities in their struggle to secure access and control over their lands, forests and livelihoods. The WRM supports efforts that defend forests and forest-dependent communities from commercial logging, dams, mining, tree plantations, shrimp farms, agribusiness, as well as other forest preservation-type projects that threaten them, like REDD+ and other offset projects that are part of the increasing trend of commodifying nature.

### **About the WRM Bulletin**

The electronic bulletin of the WRM is intended as a tool to support the struggles of peoples defending their lands and forests as well as to give visibility to the voices of many resistance struggles. Furthermore, the bulletin aims to inform and alert on international initiatives dealing with forests that might have impacts and risks for forest-dependant peoples and other populations. It has been published since 1997 and is currently distributed in four languages: Spanish, English, French and Portuguese.
